# NeoColab\_REC\_CS23231\_DATA STRUCTURES

REC\_DS using C\_Week 7\_COD\_Question 3

Attempt : 2 Total Mark : 10

Marks Obtained: 7.5

Section 1: Coding

### 1. Problem Statement

In a messaging application, users maintain a contact list with names and corresponding phone numbers. Develop a program to manage this contact list using a dictionary implemented with hashing.

The program allows users to add contacts, delete contacts, and check if a specific contact exists. Additionally, it provides an option to print the contact list in the order of insertion.

## **Input Format**

The first line consists of an integer n, representing the number of contact pairs to be inserted.

Each of the next n lines consists of two strings separated by a space: the name of the contact (key) and the corresponding phone number (value).

The last line contains a string k, representing the contact to be checked or removed.

# **Output Format**

If the given contact exists in the dictionary:

- 1. The first line prints "The given key is removed!" after removing it.
- 2. The next n 1 lines print the updated contact list in the format: "Key: X; Value: Y" where X represents the contact's name and Y represents the phone number.

If the given contact does not exist in the dictionary:

- 1. The first line prints "The given key is not found!".
- 2. The next n lines print the original contact list in the format: "Key: X; Value: Y" where X represents the contact's name and Y represents the phone number.

Refer to the sample outputs for the formatting specifications.

## Sample Test Case

Input: 3 Alice 1234567890 Bob 9876543210 Charlie 4567890123 Bob

Output: The given key is removed! Key: Alice; Value: 1234567890 Key: Charlie; Value: 4567890123

#### Answer

long int insertionOrder[1000];
long int k=0;

void insertKeyValuePair(Dictionary \*dict, const char \*key, const char \*value) {
 long int index=0;

```
for(int i=0; key[i]!='\0'; i++){
    index+=key[i];
  index=index%dict->capacity;
  while(dict->pairs[index].key[0]!='\0'){
    index=(index+1)%dict->capacity;
  insertionOrder[k++]=index;
  strcpy(dict->pairs[index].key, key);
  strcpy(dict->pairs[index].value, value);
void removeKeyValuePair(Dictionary *dict, const char *key) {
  long int index=0;
  for(int i=0; key[i]!='\0'; i++){
    index+=key[i];
  index=index%dict->capacity;
  while(strcmp(dict->pairs[index].key, key))index=(index+1)%dict->capacity;
  dict->pairs[index].key[0]='\0';
  dict->pairs[index].value[0]='\0';
  for(int i=0; i< k; i++){
    if (insertionOrder[i]==index){
       insertionOrder[i]=-1;
  }
int doesKeyExist(Dictionary *dict, const char *key) {
for(long int i=0; i<dict->capacity;i++){
    if (!strcmp(dict->pairs[i].key, key))return 1;
  return 0;
void printDictionary(Dictionary *dict) {
  for(long int i=0; i< k; i++){
    if (insertionOrder[i]==-1)continue;
    printf("Key: %s; Value: %s\n",dict->pairs[insertionOrder[i]].key, dict-
>pairs[insertionOrder[i]].value);
                                                                       Marks : 7.5/10
Status: Partially correct
```
